Clinical image description

Two month old male child presented at pediatric gastroenterology clinic of a tertiary care hospital in Delhi, India with persistent cough with choking during feeding. He also had vomiting after feed. On upper gastrointestinal endoscopy, esophageal stricture was seen at 13 cm from incisor with evidence of Tracheo-esophageal fistula adjacent to stricture. He was referred to Pediatric surgery for surgical closure of fistula.

Teaching Point: Persistent cough with feeding needs UGI Endoscopy and UGI Endoscopy can identify Tracheo-esophageal fistula.
